AI Tools Used

ChatGPT (GPT-5.5 Thinking) was used to help debug and rewrite parts of this Firebase chatroom project.

Scope of Usage

Files assisted: index.html, style.css, main.js, firestore.rules, and README.md. The assistance focused on fixing Firebase initialization, implementing authentication/profile/chatroom/message features, and documenting local setup.

Prompt Summary

The prompt asked to solve the Firebase auth/invalid-api-key error shown in the screenshot and complete the project according to the midterm PPT requirements.

Refinement and Explanation

The project now uses Firebase Hosting reserved init script when deployed, with a fallback config for local testing. Messages are escaped before rendering to prevent HTML/script execution. Firestore stores users, rooms, and room message subcollections. Only authenticated users may access Firestore according to the rules.

Important note

Before submission, the student should replace this summary with exact prompts, responses, screenshots, and final line numbers required by the course if AI-assisted code is submitted.
